But to have this becomes completely unreasonable we cannot have everyone lying isolated 14 days without symptoms surely there is no evidence at all for it. Occasional virus could be cultured day nine. Should you then not lie [down] up [to] 4-5 weeks before you are considered infection-free

Sincerely
Anders Tegnell
Head of Department

Hej!

This was presented by Maria van Kerkhove at yesterday's meeting in 'my' WHO group. 10 + 3 rule seems to be common in many countries, ie discharge at least 10 days after onset of symptoms and at least 3 after symptom relief.

Johan
